The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at the invention are also useful in physical arrays of molecules and as of the invention are also useful in physical arrays of molecules and as column the interesting markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme cancing conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, increased resistance to plant disease, for producing galactomannan, increased resistance to plant disease, for producing galactomannan, cecombination in plants, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This is the amino acid sequence of a plant full length insert in content. This is the amino acid sequence of a plant full length insert in content.
                                                                                                                                                                                                                                                                                                                                                                                                                                     New recombinant DNA construct, useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens pests, for conferring increased resistance to plant disease, or for improving yield.
growth rate; cell cycle pathway; disease resistance; galactomannan production; lighin production; plant growth regulator; yield; plant growth; plant development; seed oil; protein yield; protein content.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 234;

                                                                                                                                                                                                                              (ZHOU/)
```

The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in nelectronic form from the US patent office at available in electronic form from the US patent office at the sequence. Lend?Doc10120040388. The polynucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or treas condition or for modifying seed oil or protein yield and/or content. This is the amino acid sequence of a plant full length insert in the propertie that can be used in the recombinant DNA construct of the invention.

Propionibacterium acnes.

WO2003033515-A1.

24-APR-2003

```
Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies peptific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                    SAPHO syndrome, synovitis, acne; pustulosis; hypertosis; osteomyelitis; uvaitis; endopthealmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bhatia A;

The invention relates to an isolated polynucleotide (ACF64435-ACF64733)

cncoding a Propionibacterium acnes protein. The invention also relates to encoded by the polynucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a additionally encompasses expression vectors and host cells comprising a polymetric cells comprising a polymetric of the invention; fusion proteins comprising a polypeptide of the invention; and an isolated T cell population comprising P. acnes polypeptides, or this method; a vaccine composition (comprising P. acnes polypeptides, via this method; a vaccine composition (comprising P. acnes polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations, or can ignor presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a configuration or antigen-presenting cells that express the polymetric or an include propulations or antigen-presenting cells that express the polymetric or an include propulation or antigen-presenting cells that express the polymetric or an include propulation or antigen-presenting cells that express the polymetric or a protein. The polymucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the primers for the kit is useful for performing a diagnostic assay. The present or eading frame) contained within the P. acnes polymetric does not contained within the P. acnes polymetric or the reacting contained within the P. acnes polymetric or the primers for reading frame) contained within the P. acnes polymetric desay. The present or and the kit is useful for performing a diagnostic assay. The present creating rrane) contained within the P. acnes polymetric does not for tracating accidence invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electron
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 392;

The invention relates a recombinant DNA construct comprising a polypuclectide having any of 5544 mucleotide sequences (CDNAs SEQ ID NO: 1-5544) and encoding a polypeptide with any of 5544 amino acid sequences (SEQ ID NO: 5545-11088). The CDNAs and proteins are from corn, sovbean, Arabidopsis, wheat and rape but the specification does not indicate which sequences is derived from which organism. Also included is a method of producing a plant having an improved property, comprising transforming a plant with a recombinant DNA construct comprising a promoter region functional in a plant cell operably joined to a polypucleotide encoding a polypeptide associated with the property, and growing the transformed plant. The property is selected from improving plant cold tolerance, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for improving plant drought tolerance, for production, for production cesistance to plant disease, for galactomannan production, for production improving plant tolerance to herbicides, for increasing the rate of comprising the rate of colorance to plant tolerance to herbicides, for increasing the rate of colorance to plant tolerance to herbicides, for increasing the rate of colorance to plant tolerance to herbicides, for increasing the rate of colorance to plant tolerance to monologous recombination in plants, for ingroving plant tolerance to extreme computions, for improving plant tolerance conditions, for improving plant tolerance conditions, for improving plant tolerance conditions, for improving plant tolerance conditions, for improving plant tolerance conditions, for improving plant tolerance conditions, for improving plant tolerance conditions, for improving plant tolerance conditions, for improving plant conditions, for improving plant tolerance conditions, for improving plant conditions, for improving plant conditions, for improving plant conditions, for improving plant conditions, for improving plant conditions, for improving plant conditions, for impr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New recombinant DNA constructs useful in the field of biochemistry and genetics, and in particular for producing transgenic plants with improved biological characteristics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  tolerance to pathogens or pests, for yield improvement by modification of photosynthesis, for modifying seed oil yield and/or content, for modifying seed oil yield and/or content, for modification of carbohyare, nitrogen or phosphorus use and/or uptake and for yield improvement by providing improved plant growth and development under at least one stress condition. The polymicleotide may also encode a plant transcription factor. The methods and compositions of the present invention are useful in the field of biochemistry and

Also disclosed are vectors, expression casettes, host cells, and plants containing such polynucleotides. Also disclosed are methods for using the polynucleotides and polypeptides to alter the responsiveness of a plant to abiotic stress. The invention is useful in agriculture. The nucleic acid is useful for determining whether a test plant has been exposed to an abiotic stress condition. It is also useful for selecting an agent that alters abiotic stress regulated polynucleotide expression in a plant cell, and to identify a homolog or ortholog to an abiotic stress responsive polynucleotide. The nucleic acid molecule and the polypeptide encoded by it are useful in altering the stress; nesponsiveness of a plant to an abiotic stress, such as cold stress, salt stress, osmotic stress or any of their combinations. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New stress-responsive nucleic acid, useful for altering the responsiveness of a plant, e.g. cereal, to an abiotic stress such as cold stress, salt stress or osmotic stress.
               tolerance to plant peets or pathogens. They can also be used in physical arrays of molecules, plant breeding markers, computer-based storage and analysis systems. The present sequence is one of the 5544 plant protein sequences of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in sequence commat directly from USPTO at seqdata.uspto.gov/sequence.html?DocID=20040216190.
extreme osmotic and drought conditions, and improving plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          abiotic stress tolerance; transgenic plant; plant; cereal; agriculture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Goff SA, Katagiri F;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              human G protein linked thrombin receptor sequence. The peptides, which human G protein linked thrombin receptor sequence. The peptides, which may be cyclic, have the formula X1-P81-X2-X3-Omega-X4 in which Psi = any con-) natural aromatic amino acid (aa); Omega = any (non-) natural basic a or derivatives; X1 is absent or is a natural aa, 1-3C acyl or 1-5C alkyl; X2 = any natural aa, The peptides are are antagonists and a spent or is any natural aa, The peptides are are antagonists and agonists for treating disorders involving thrombin receptors, e.g. cardiovascular, inflammatory or gastrointestinal diseases; osteoporosis; tissue injury and repair (including nerve regeneration); and cancer (by inhibiting angiogenesis and metastasis). They may also be used inhibiting angiogenesis and metastasis). They may also be used particularly used to modulate platelet function (acting synergistically cut aspirin-type compounds) and so are useful in cases of myocardial formation, as well as to coat prostheses and to reduce arterial plaque

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of altering the degree of internalization of a Clostridial toxin into a cell by altering an activity of a lipid raft on a membrane of a cell. The method is useful in altering the degree of internalization of a Clostridial toxin into a cell for preparing a composition for treating a disease associated with lipid rafts, e.g., hepatic insulin resistance, obesity, diabetes, hematopoietic condition, immuno-inflammatory condition or Alzheimer's disease. This sequence corresponds to a synthetic version of a thrombin receptor peptide to alter the formation of a lipid raft associated with vesicle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Altering the degree of internalization of a Clostridial toxin into a cell comprises altering an activity of a lipid raft on a membrane of a cell for preparing a composition for treating e.g., obesity.

The invention relates to a novel serum-free medium for mammalian cells consisting of a basic medium, a cell viability protection agent, insulin and thrombin. The cell viability protection agent is selected from ADC-1, a protein hydrolysate or methyl cellulose. The invention also relates to a mammalian cell line adapted for production of a biologically active production in the serum-free medium. The serum-free medium is useful in the production of mammalian cell products, such as proteins, monoclonal antigons. Unlike previous serum-free culture media. The new medium has minimal additives, thereby being less costly, and does not contain intendents that are likely to complicate the culturing/

or production/purification processes. The present sequence represents a fragment of hamster thrombin used in place of native thrombin in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acids encoding 4277 human colon cancer-associated polypeptides, useful for preventing, diagnosing and/or treating colorectal cancers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The thrombin receptor activator is a component of a serum free medium for growing mammalian cells. The medium also comprises a viability protection agent, insulin and thrombin when thrombin receptor activators are absent. This sequence corresponds to amino acid residues 42-55 of the hamster thrombin receptor. See also AAR47228-R47231. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                Serum free medium for growing mammalian cells - contains viability protection agent, insulin and thrombin or thrombin receptor activator,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and cancer antigens have cytostatic activity and can be used in gene therapy cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased carpession by rectifying mutations or deletions in a patient s genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P carcinomas and cancers. Adally 196 to Additionally, and P perseent carcinomas and cancers. Adally 196 to Additionally and Perseent of colorectal carcinomas and cancers. Adally 196 to Adally 200 and Adally 198 to sequences used in the exemplification of the present invention. N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027

proteins (1) and polynucleotide (II) sequences. (1) and (II) have various activities based on the tissues and cells the genes are expressed in.

Example of these activities include: immunomodulatory; antisclerotic; dermatclogical; immunosuppressive, antiinflammatory; immunostimulant; anti-angiogenic; ophthalmological; cardiant; anti-angiogenic; ophthalmological; cardiant; anti-angiogenic; ophthalmological; neuroprotective; nootropic; anticonvulsant; antialzheimers; vascular; neuroprotective; nootropic; and vulnerary. (1) and (II) can be used in gene therapy and vaccine production. (1) and (II) can be used in gene therapy and vaccine production. (1) and (II) can be used in the prevention, diagnosis and treatment of immune disorders (e.g. multiple sclerosis, systemic lupus erythematcous and human immunodeficiency virus (HIV) infections), hyperproliferative disorders (e.g. cancers and Gaucher's disease), cardiowysacular diseases (e.g. canters syndrome, chaga's cardiomyopathy and coronary arteriosclerosis), andiogenic disorders (e.g. corneal graft neovascularisation and diabetic retinopathy), neurological disorders (e.g. Huntington's chorea, Alzheimer's diseases and Parkinson's disease), infectious diseases and/or for promoting wound healing, regeneration and/or chemotaxis. ABA83185 to ABA83193 and ABB50300 represent sequences used in the exemplification of

useful for preparing a composition for diagnosing or treating autoimmune disorders e.g. multiple sclerosis and systemic lupus erythematosus; considerate e.g. multiple sclerosis and systemic lupus erythematosus; considerate e.g. agammaglobulinaemia and ataxia telangiectasia; blood coagulation disorders e.g. aflbrinogenaemia and thrombocytopenia; allergy; graft-versus-host disease; inflammatory conditions e.g. ischaemia-reperfusion injury and arthritis; hyperproliferative disorders e.g. cancer and purpura; infectious disease e.g. viral infection and bacterial infection. The polymucleotide or protein can be used to regenerate damaged tissue e.g. ulcers and Alzhaimer's disease. The present sequence represents the amino acid sequence of a novel human secreted protein fragment. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from uSPTO at sequence. Sequence chample of the printed specification but sequence uspto.gov/sequence.html?DocID=20030065160
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Secreted protein; precerebellin-like protein; sepsis; acne; psoriasis; neurodegenerative disorder; behavioural disorder; Alzheimer's disease; Parkinson's disease; Huntington's disease; schizophrenia; mania; dementia; paranoia; psychosis; autism; immune disorder; infection; inflammation; allergy; liver disorder; hepatoblastoma; jaundice; hepatitis; immunological disorder; AIDS; leukaemia; rheumatoid arthritis;

The invention relates to an isolated protein comprising amino acid
residues 33-205 or 1-205 of a novel human secreted protein appearing as
ABD26252. The protein is encoded by one of 238 disclosed cDNA sequences
encoding 238 secreted proteins. ABD26252 is a precerebellin-like protein.
Also included are a composition comprising the protein and a carrier and
an isolated protein produced by expressing the protein cited above by a
cell, and recovering the protein. The proteins are useful for diagnosing
or treating neurodegenerative and behavioural disorders (e.g. Alzheimer's
disease, Parkinson's disease, Huntington's disease, exclizophrenia, mania,
dementia, paranola, psychoses or autient disorders (e.g. Alzheimer's
infection, inflammation, allergy), liver disorders (e.g. hepatoblastoma,
rheumatoid arthritis, sepsis, acne, psoriasis) and cancer. The present
sequence is a protein associated with one of the 238 disclosed novel

Novel secreted protein 5' expressed sequence tag sequences used in

ö

Gaps

.; 0

```
AAZ42265 to AAZ43075 represent novel 5' expressed sequence tag (EST)

CC sequences, corresponding to human secreted proteins. AAY64651 to AAZ43052.

CC represent the EST-related proteins corresponding to AAZ42265 to AAZ43052.

CT be 5' ESTB can be used for producing secreted human gene products. They

CC can be used to identify and isolate 5' untranslated regions (UTRS) and

Upstream regulatory regions which control the location, development

CC stage, rate, and quantity of protein synthesis, as well as stability of

CMANA. The ESTB are also useful as probes for chromosome mapping, and to

CC chage, rate, and quantity of protein synthesis as well as stability of

CC mRNA. The ESTB are also useful as probes for chromosome mapping, and to

CC chage. The products may also be used in forensic

CC identify individuals having genetic diseases resulting from abnormal gene

CC cypression. The products may also be used in gene therapy protocols. The

CC conclinian secretion of a polypeptide or the insertion of a

CC collular secretion of a polypeptide or the insertion of a

CC proteins encoded by the EST sequences may be useful in treating a variety

CC human conditions. Secreted proteins have therapeutic value, and the

CI dentification of new secreted proteins is valuable. AAZ42249 to AAZ42264

The invention relates to an isolated or purified signal peptide consisting of residues 1.16 of ADU72234 (signal peptide given separately as ADU73026) which directs the extracellular secretion of a polypeptide to which it is oberably linked. The invention also relates to a method of producing the signal peptide. The invention also relates to a method of producing the signal peptide. The invention further discloses: isolated, encode all or a part of a secretory signal peptide; polypeptides encoded by these ESTS (EST-related polypeptides), antibodies which recognize the servated polypeptides; vectors and host cells computating EST-related nucleic acids of the invention; an array of ESTS; methods involving the use of ESTS of the invention, for example, in identifying a promoter in genomic DNA. The EST-encoded signal peptides of the invention of intentitying a promoter in generation of protein fusions comprising the invention can be used for directing the secretion or import of a cernical peptides. The ESTS, EST-encoded signal peptides of the invention can be used for forensic procedures, chromosome mapping, diagnostics, and therapeutic procedures, including gene therapy.

Sequences ADU72215-ADU72319 represent incomplete polypeptides comprising a signal peptide which are encoded by the 5' ESTS shown in ADU7427- by an application of the encoded by the 5' ESTS shown in ADU7427- of the brown of the encoded by the 5' ESTS shown in ADU7427- of the brown of the encoded by the 5' ESTS shown in ADU7427- of the brown of the encoded by the 5' ESTS shown in ADU7427- of the encoded by the 5' ESTS shown in ADU7427- of the encoded by the 5' ESTS shown in ADU7427- of the encoded by the 5' ESTS shown in ADU7427- of the encoded by the 5' ESTS shown in ADU7427- of the encoded by the 5' ESTS shown in ADU7427- of the encoded by the 5' ESTS shown in ADU7427- of the encoded and a for this patent did not form part of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ADU72131. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                    New expressed sequence tags and encoded human proteins useful for diagnosing, preventing or treating diseases such as autoimmune disorders, inflammation, wounds or infections, or in forensic or chromosome mapping
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   expressed sequence tag; EST; expression; protein secretion; diagnostic; forensic; gene therapy; haplotype mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human incomplete polypeptide including a signal peptide SEQ ID NO:1297.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

The invention relates to a novel purified nucleic acid (I) comprising any of (ADZ72418-ADZ73205) or (ADZ73994-ADZ74016) and their complements; at least 15 consecutive nucleotides of (I) and their complements; at any of 788 nucleotide sequences encoding (III) defined sequences of 16-255 amino acids (ADZ73206-ADZ73993). The invention discloses 5' EST's derived from RNAB encoding secreted proteins. The 5' EST's may be used to obtain compositions of the present invention are useful for expressing secreted proteins or its portions (claimed) or to obtain antibodies capable of specifically binding to the secreted proteins, and in diagnostic, forensic, gene therapy, and chromosome mapping procedures, and for designing expression vectors and secretion vectors. The present sequence is used in the exemplification of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied in electronic format from the EST. USPTO web site sequence.html; bocument ID: 20050106595.
                                                                New purified nucleic acid expressing secreted proteins useful in forensic, gene therapy, and chromosome mapping procedures, and diagnosing or treating cancer, atherosclerosis and autoimmune diseases, diabetes, asthma and infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acids encoding Haemophilus transferrin receptor - used to prods for detection and in diagnosis, prevention and treatment of Haemophilus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Loosmore S, Harkness R, Schryvers A, Chong P, Gray-Owen S;

regions of the Tbp1 protein from H. influenzae strains Eagan, MinnA, Du63 and non-typable strain PAR12085. The transferrin receptor (TfR) operon consists of two genes (Tbp1 and Tbp2) arranged in tandem and which are transcribed from a single promoter. H. influenzae TfR is iron- and/or haemin-regulated and a putative fur-binding site has been identified upstream of tbp2. Antibodies blocking this binding site may prevent bacterial growth. Fragments of the TfR (or its genes) are useful in vaccines to provide protection against, e.g. bacterial meniagitis. An advantage of using the TfR is that it shares homology with TfR of other H. influenzae strains including non-typable strains. The present sequence shows residues 315-350 of Tbp1 from H. influenzae type b strain Di63 (see AAR77884), not residues 293-328 as stated in the specification. Numbering of the residues is said to be as for strain Di63.
                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAW46090-125 are predicted antigenic peptides derived from the Tbpl protein of Haemophilus influenzae type b. Tbpl is part of the transferrin receptor, of which Tbp2 is also a subunit. The deduced amino acid sequences of Tbpl and Tbp2 were compared, and regions of conservation

                                                                                                                                                                   g
                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ठ
                                                                                                                                                                                                                                                  ö
identified. The above peptides are derived from these regions, the present peptide being derived from residues 293-328. Iron is an essential nutrient for the growth of these bacteria, and they can utilise human transferrin as a source of iron. Antibodies which block the access of the transferrin receptor to its iron source prevent bacterial growth. The transferrin receptor, or fragments, therefore, are good vaccine candidates. An immunogenic composition comprising (or encoding) the immunogenic truncated analogue can be used to induce protection against a disease caused by a bacterial pathogen that produces the transferrin receptor. The immunogenic truncated analogue is also useful as an antigen in immunoassasy for the detection of Haemophilus transferrin receptor antibodies, while the nucleic acid molecule can be used as a hybridisation probe for the detection of other transferrin receptor genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel isolated and purified nucleic acid (I) encoding an immunogenic, C-terminally truncated analog of one of the transferrin receptor proteins Tbpl or Tbp2 of Haemophilus influenzae which has antibacterial activity. (I) are detecting, and diagnosing of truncated Tbp; as probes and primers for detecting, and diagnosing infection by, Haemophilus, also for isolating similar sequences from other bacteria; as immunogens for vaccinating against infections caused by bacteria that produce transferrin receptors, e.g. Haemophilus, Neissearia or Branhamella. The truncated proteins are useful as immunogens (as above); for diagnosing infection (as antigens in immunoassays) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      - used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Transferrin receptor; Tbp1; Tbp2; immunogenic; antibacterial; vaccine;

immunization. AAY51695-Y31767 represent H. influenzae transferrin receptor proteins Tbpl and Tbp2 antigenic peptide fragments
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptides AAWS3050-WS3085 are derived from the Tbpl protein. The Tbpl protein is one of two proteins with genes found on the transferrin operon. These peptides can be used along with the genes, DNA sequences and recombinant proteins for diagnosis, immunisation and the generation of diagnostic and immunological reagents. They can also be used to protect from bacteria that produce transferrin receptor protein
                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antibodies specific for transferrin receptor proteins of Haemophilus influenzae, useful for treating otitis media, epiglottitis, pneumonia and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to novel antibodies (or monospecific antisera) specific for single transferrin receptor proteins (or immunogenic fragment) from strains of Haemophilus influenzae. This sequence corresponds to an epitope from the H. influenzae transferrin receptor protein Tbpl. The antibodies may be used for preventing and treating infections and disorders caused by H. influenzae, including bacterial meningitis, otitis media, epiglottitis, pneumonia and tracheboronchitis. The antibodies may also be used detect the presence of H. influenzae proteins in samples according to standard methodologies (e.g. enzyme linked immunosorbant assay (ELISA)) and hence diagnose infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of mediacal conditions caused by a canes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies polypeptides may be used as antigens in the production of antibodies contacting the capression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used the cherefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was considered in electronic format directly from NIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                             Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Propionibacterium acnes predicted ORF-encoded polypeptide #14743.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .

Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; foetal liver; gene expression; single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Peptide #11805 encoded by human foetal liver single exon probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              h Similarity 100.0%; Score 5; DB 4; Length 60; Similarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated polynucleotide (ACF64415-ACF64733)

cncoding a Propionibacterium acres protein. The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acres polypeptides. The invention additionally encompasses expression vectors and host cells comprising a difficiently encompasses expression vectors and host cells comprising a polypeptide of the invention; and proteins comprising a polypeptide of the invention; and proteins comprising a polypeptide of the invention; and method for stimulating an immune response specific for a P. acres polypeptides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptides, and a method for inhibiting the development of P. acres in a patient; and a method for inhibiting the development of P. acres in a patient. The P. acres polypeptides, polypeptides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the collypeptides are useful for inhibiting the development of P. acres in a patient. The polymentions or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acre vulgaris, or for stimulations or antigen-presenting or treating acre culculation of an immune response specific for a P. acres protein. The polymuleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the estimulation of an immune response capaints P. acres; or for stimulation capacing adjagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open cadding frame) contained within the P. acres polymuleotides of the primited specification, but was obtained in electronic format directly for the primited specification, and the proper format directly acres in the primited specification, and the proper format directly acres in the primited specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                            n genome-derived single exon nucleic acid probes useful for analyzing expression in human fetal liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptide #12287 encoded by probe for measuring placental gene expression.

The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmiss and congenital heart disease. Note: The sequence data for this patent did not form part of the printed
                                                          The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Protein #9158 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Single exon nucleic acid probes for analyzing gene expression in human

```
probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                Human; brain expressed exon; gene expression analysis; probe; microarray; Alzheimer's disease; multiple sclerosis; schizophrenia; epilepsy; cancer.
                                                                                                                             Human brain expressed single exon probe encoded protein SEQ ID NO: 37441.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides a number of single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, liver, cirrhosis, hyperlipoproteinaemia, hyperlipidaemia,
hypercholesterolaemia, coronary heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 4; SEQ ID NO 37441; 650pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   55.6%; Score 5; DB 4; Length 60; 100.0%; Pred.
